SUMMARY

Data Engineer at Jio Platforms — co-owning **300+ production workflows** across **6,000+ tables**. Deployed **lazyfruit.com** — an AI-powered job platform with **3,000+ live listings** that received a **pre-seed funding offer** (operating bootstrapped by choice). Looking for high-ownership data and platform roles at product-led companies.

TECHNICAL SKILLS

Languages: Python, SQL, Shell Scripting

Big Data & Processing: PySpark, Databricks, Delta Lake, Hadoop, Hive

Orchestration & Streaming: Apache Airflow, Apache Kafka, Apache NiFi

Cloud: Azure (ADF, ADLS Gen2, Databricks), AWS (EC2, S3, Glue, Redshift, Lambda)

Databases: PostgreSQL, MSSQL, MongoDB, Oracle

AI & APIs: LangGraph, Gemini API, FastAPI, REST APIs

EXPERIENCE

Jio Platform Limited (JPL) – Data Engineer

Dec 2023 – Present

- Delivered **300+ workflows co-owning 6,000+ Delta Bronze tables** across Oracle, MSSQL, and MongoDB sources by using an ingestion framework — a 19-column CSV config and single parameterized notebook eliminated per-workflow boilerplate. (*Databricks Asset Bundles, Auto Loader, ADLS Gen2*)
- Built and deployed **100+ serverless streaming pipelines** ingesting data from 20 telco BSS source systems (Ericsson, CleverTap, NSE, NSD, EPC XML) into Delta Bronze, using a Lakeflow framework with exactly-once semantics. (*Kafka, Airflow, AZcopy, ADLS Gen2, Auto Loader, DLT, Unity Catalog*)
- Migrated **50+ Partner Center workflows** (1M–10M+ daily records) from **legacy Informatica to Databricks gold layer**, eliminating per-workflow license dependency and consolidating onto a single lakehouse stack while improving runtime by ~15%.
- Eliminated redundant reprocessing of **10,000+ daily files** (PDFs, DOCXs, JPGs) by engineering incremental file-detection across a NAS → ADLS document pipeline (DocFlow). (*Airflow, ADF, Databricks*)
- Drove the cloud-migration architecture POC, recommending NiFi for ~1TB+/unit historical ingestion and ADF for full & incremental loads — **adopted across 400+ pipelines**.
- Built a **Trade Compliance aggregation pipeline** powering downstream BI reports for the import-clearance business team — consolidated 50+ source tables (10K–1M+ records each) into a unified Databricks aggregate, reducing report-refresh runtime to ~**30 min** via caching, repartitioning, and broadcast joins.
- Maintained ~**99% pipeline uptime** over 12+ months by monitoring 200+ Airflow DAGs, resolving Spark/YARN bottlenecks, and implementing failure alerting.

PROJECTS

- AI-Powered Job Aggregation Platform** | *Python, Playwright, LangGraph, FastAPI, PostgreSQL, AWS* | <https://www.lazyfruit.com> · engineering write-up
Built an **end-to-end ingestion pipeline** landing **3,000+ live listings** into PostgreSQL, with **CDC-style lifecycle tracking** (active/inactive state per scrape cycle), schema normalization across heterogeneous sources, and dedup on incremental loads. An **LLM-driven extraction layer** (Gemini API) autonomously selects navigation strategy and handles pagination, with **adaptive model escalation** on incomplete extraction and **asyncio** concurrency across 5 parallel workers. **FastAPI + WebSocket** pipeline-monitoring UI. **Received pre-seed funding offer** — operating bootstrapped by choice.
- PySpark DataFrame Lineage Tool** | *Python AST, React, Vite*
Static lineage analyzer that parses PySpark source via **Python AST** — no execution or instrumentation required — to reconstruct **column-level lineage** across **10+ transformation types** (joins, filters, aggregations, column ops). Resolves transformation chains into a node-edge dependency graph with downstream usage tracking, surfaced through a lightweight React frontend.

EDUCATION

Lakshmi Narain College of Technology and Science

B.Tech in Computer Science and Engineering

May 2019 – May 2023

CGPA: **8.7/10.0**
